Step 1: Define the notation

$i = 1, 2, 3$ : the number of countries (Country $i$)

$j = 1, 2, 3, 4, 5$ : the number of medical teams

Binary decision variable $x_{ij}$ : $x_{ij} = 1$ only if Country $i$ is allocated with $j$ teams ; otherwise, $x_{i,j} = 0$

$R_{ij}$ : Additional person-years for Country $i$ with $j$ teams

Step 2: Set LP model

Objective function : $\text{Max } Z = \sum_{i=1}^{3} \sum_{j=1}^{5} R_{i,j} \cdot x_{i,j}$

Constraints : ① each country is assigned exactly one allocation level

$$\sum_{j=1}^{5} x_{i,j} = 1 \ , \ \forall i \in \{1, 2, 3\}$$

② total number of medical teams can't exceed 5

$$\sum_{i=1}^{3} \sum_{j=1}^{5} j \cdot x_{i,j} \leq 5$$

③ $x_{i,j}$ is binary variable

$$x_{ij} \in \{0, 1\} \ , \ \forall i \in \{1, 2, 3\}$$

LP Model :

$$\text{Max } Z = \sum_{i=1}^{3} \sum_{j=1}^{5} R_{i,j} \cdot x_{i,j}$$

$$\text{s.t.} \quad \sum_{j=1}^{5} x_{i,j} = 1 \ , \ \forall i \in \{1, 2, 3\}$$

$$\sum_{i=1}^{3} \sum_{j=1}^{5} j \cdot x_{i,j} \leq 5$$

$$x_{ij} \in \{0, 1\} \ , \ \forall i \in \{1, 2, 3\}$$
